

Emission Control Systems

The Vehicle Emission Control Information label (1) is attached to the frame below the seat.

Source of Exhaust Emissions

The combustion process produces carbon monoxide (CO), oxides of nitrogen (NO_x) and hydrocarbons (HC). Control of hydrocarbons and oxides of nitrogen is very important because, under certain conditions, they react to form photochemical smog when subjected to sunlight. Carbon monoxide does not react in the same way, but it is toxic.

Honda Motor Co., Ltd. utilizes specific carburetor settings and other systems to reduce carbon monoxide, oxides of nitrogen and hydrocarbons.
