

## Engine Oil

### **Note:**

The engine, the muffler and the exhaust pipes are extremely hot after stopping the engine.

### Oil Level

1. Park the motorcycle on a flat surface. Warm up the engine at idling rpm for a few minutes.
2. Stop the engine and leave the motorcycle for a few minutes.  
Hold the motorcycle upright and check the oil level window.  
The oil level should be between the maximum and the minimum lines.
3. If the level is close to the minimum level, add oil up to the maximum level.

Refer to the next page for adding oil.
