

## EMISSION CONTROL SYSTEM (USA ONLY)

- **Source of Emissions**

The combustion process produces carbon monoxide and hydrocarbons. Control of hydrocarbons is very important because, under certain conditions, they react to form photochemical smog when subjected to sunlight. Carbon monoxide does not react in the same way, but it is toxic.

Honda Motor Co., Ltd. has designed a lean setting carburetor and other systems to reduce carbon monoxide and hydrocarbons.

- **Exhaust Emission Control System**

The exhaust emission control system is composed of a lean setting carburetor, and no adjustments should be made except idle speed adjustment with the throttle stop screw. The exhaust emission control system is separate from the crankcase emission control system.
